PROFESSIONAL EXPERIENCE

BrowserStack

Mumbai

Software Engineer - Backend, Platform Team

Apr 2025 – July 2026 (role eliminated)

Product Features Shipped

- Built an **LLM-powered** (Claude) pipeline auto-generating SDK framework support, cutting new-SDK delivery **2 weeks to 1 day**.
- Designed and shipped an **RBAC** system (roles, hierarchies, 14 check-points), enabling org-wide permissions for **50k+ customers**.
- Delivered **multi-language SDK support** across **5B+ API calls** via client-aware routing to non-English enterprise markets.
- Architected a **CDC pipeline** (35 Debezium connectors) syncing **10TB MySQL** to **ClickHouse**, supporting **5B+ inserts/updates**.
- Led the launch of BrowserStack's Australia AWS region for GDPR/data-residency, now handling **360K requests/hour** in production.
- Halved per-session auth calls (2 to 1) for accessibility products via a lightweight config service, cutting **102K auth calls/day**.

Platform & Performance

- Drove **208x query speed up** (9.6s to 46ms) on a 524M-row analytics table via zero-downtime schema migrations across 4 regions.
- Cut dashboard load for **OpenAI** from **4 min to 3s** by indexing high-cardinality queries, directly unblocking a stalled enterprise deal.
- Migrated primary keys on 3 tables of **1B+ rows** (1 TB, 2.9M rows/day) live in production, with no downtime or outages.
- Offloaded heavy aggregate queries from MySQL to ClickHouse, cutting database CPU from **96% to 30%** and enabling future growth.
- Remediated SQL injection across 200+ APIs and shipped Static CI security scanning covering **98% of production traffic**.
- Resolved **2 critical vulnerabilities** (RCE and SSRF bypass) and enabled TLS for database connections to harden production security.

Zus (formerly Ochain)

Remote

Software Engineer - Backend, Blockchain Storage (Full-time Remote Contract)

Feb 2022 – Mar 2025

- Played a central role in architecting and maintaining **OChain's mainnet blockchain** (core codebase, monitoring), sustaining **1.4 years** of production uptime with zero major failures across **130M+ transactions**.
- Contributed to **blobber**, a distributed object storage system in **Golang**, using concurrency primitives and **Merkle trees** for cryptographic proof-of-storage.
- Contributed to **gosdk**, the client SDK (shipped as **WebAssembly** & mobile SDK) for object storage, implementing **erasure encoding** for fault-tolerant, **10K+ concurrent** transactions; also contributed to its **zboxcli/zwalletcli** CLI tooling.
- Contributed to redesigning the **Storage Smart Contract** (allocation lifecycle, challenge generation/expiry, provider kill/shutdown), fixing critical defects and stabilizing production reliability.
- Contributed to the **OBox API** — request flows, Kafka event replication, Stripe subscriptions — powering 5 web, 2 iOS, 2 Android, 1 macOS, and 1 Windows apps.
- Automated dynamic **Sharder/Miner** (consensus-node) management and contributed to a major consensus upgrade (**View Change**) enabling dynamic node rotation via **Magic Blocks**, boosting developer productivity by **90%**.

OPEN SOURCE CONTRIBUTIONS

Oppia Foundation (GSoC) [Merged PRs]

Mountain View, CA (Remote)

OSS Contributor & GSoC

Jun 2021 – Jan 2022

- Contributed to **Gradle to Bazel** migration, achieving **10x improvement** in build speeds; built **CI/CD pipelines** automating deployment to Google Drive, GCP, and Play Store for 4+ tracks.
- Mentored **3+** students and authored **70+ unit** and **20+ E2E tests** across a modular MVVM/MVP codebase.

PROJECTS

JobBorg

Personal Project

Multi-User Job-Search Automation Platform — Django, Celery, PostgreSQL, Redis, Docker

- Designed a modular Ingestion → Classification → Matching → Recommendation pipeline, each stage an independent **Celery** task on a Redis-backed queue with Celery Beat scheduling.
- Built idempotent hourly ingestion from the **Greenhouse ATS API** (keyed on source-ID pairs), with change-aware classification that only reruns on content diffs.
- Shipped a multi-container **Docker** deployment (Postgres w/ pgvector, Redis, Prometheus, Loki, Grafana) for metrics, log aggregation, and dashboards.
- Built a **Playwright**-driven auto-apply engine that fills real Greenhouse forms, constraining LLM answers via a deterministic validation gate and failing closed on any unresolved field — covered by **290 automated tests**.

ACHIEVEMENTS

- Selected for **Google Summer of Code 2021** (Oppia Foundation).
- Won **top prize** at the **CAMS Hackathon** for developing its Android app.
- Rated **Specialist** on Codeforces (max-rating **1509**) and **5-star** on CodeChef.

TECHNICAL SKILLS

- **Languages:** Java, Go, Ruby, SQL, Python, Kotlin, C, C++
- **Frameworks:** Spring Boot, Rails, Node.js, REST APIs, gRPC, Microservices Architecture
- **Cloud & Infra:** AWS, Docker, Kubernetes, Kafka, Jenkins, Helm, CDC, CI/CD
- **Databases:** MySQL, PostgreSQL, ClickHouse, Redis, MongoDB
- **Concepts:** System Design, Distributed Systems, Event-Driven Architecture, Concurrency
- **Tools:** Prometheus, Grafana, JUnit, SAST, Claude Code, Cursor, MCP
